QuickModel: Creating BPMN 2.0 diagrams has never been easier

Everyone should be involved in process design. QuickModel supports decentralized process discovery and mapping. It allows everyone to create his first BPMN diagram in seconds. By following a spreadsheet-like approach, no previous knowledge of BPMN 2.0 is required.

QuickModel automatically creates BPMN 2.0 diagrams that can be modified in the graphical editor later on.

QuickModel

With QuickModel everybody in the organization can be involved in modeling business processes - even without any knowlegde in BPMN 2.0.

The spreadsheet-like design of Quick-Model enables process participants to edit general information such as the trigger, results and specific Key Performance Indicators of a process. In addition, it is also possible to define the executing roles, input and output documents as well as IT systems. While editing a simple table, the process is automatically designed in BPMN 2.0.

QuickModel is a professional feature especially suited for people that are rarely working with processes. Using this functionality, they can add their knowledge and expertise to the business processes.

"Process modeling has never been easier. QuickModel allows everyone to participate."

Dr. Gero Decker, CEO, Signavio Inc.

The process models designed in QuickModel can always be revised in the classical editing mode of the Signavio Process Editor. Here, the different elements of processes such as tasks,
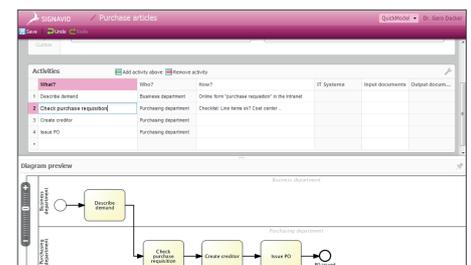

gateways and attributes can be adjusted. All changes that were made in the editing mode of the Signavio Process Editor will also be shown in the QuickModel view. Therewith, also complex process models can be opened and edited using the QuickModel feature. It enables and increases collaborative process design in the organization.

"With QuickModel we were able to include even more colleagues in process design"

Ronald Schwarz, Project Manager, T-Systems Multimedia Solutions GmbH

QuickModel nicely integrates with the Signavio process repository and the BPM collaboration portal. All changes made to a process model can be tracked using version management. Diagrams created using QuickModel can be published to all employees.
